

BUIDL CTC 2026 FALL

Emberline

Private evidence. Independent review. Verifiable release.

Submission brief / public testnet MVP

Recommended sector: RWA

01 What Emberline does

Emberline is a milestone-funding and accountability workspace. It keeps sensitive evidence outside the public ledger while making the approval process, evidence commitment, reviewer decision, and capital release inspectable.

A project owner defines sequential milestones and quorum. An implementer hashes a private delivery package locally. Independent reviewers decide against one exact revision. A milestone can release only after the policy is satisfied.

Problem	Funding often moves before delivery is independently verified, while public transparency can expose sensitive beneficiary or operational data.
Solution	Commit evidence without publishing the file, bind reviewer decisions to the exact revision, freeze disputed work, and release only the eligible tranche.
Trust boundary	The chain proves that the configured approval process occurred against a specific commitment. It does not claim that blockchain alone proves a real-world event.
Sector	RWA - off-chain delivery evidence and independent decisions connected to transparent on-chain funding policy.

Core capabilities

- + Private browser-side SHA-256 evidence hashing; files are not uploaded.
- + Immutable evidence revisions with dispute locks and complete history.
- + Independent reviewer permissions, duplicate-vote prevention, quorum, and sequential release guards.
- + Hash-chained application audit trail with tamper detection.
- + Public session-scoped sandbox for the product experience, clearly separated from the live testnet sample.

02 Attestcoin Protocol integration

The Attestcoin Protocol is the verification bridge between a reviewer decision on Ethereum Sepolia and the release policy enforced on Creditcoin testnet.

EmberlineReviewVerifier accepts an official proof only when Creditcoin's BlockProver verifies the source receipt and the receipt contains exactly one ReviewRecorded event from the configured source registry. The decoded event is bound to the reviewer, project, milestone, revision, evidence commitment, and decision. EmberlineProject checks the complete binding and prevents proof replay.

Source chain	Ethereum Sepolia review registry
Execution chain	Creditcoin testnet, chain ID 102031
Verifier	0x525749ab5390166fCEa076D50d5168d1db476cE7
Project escrow	0xB236da47fe9215E18C729050fEd3f4B77FcBBffE
Live sample	Two approved reviews, 0.01 CTC released, testnet only

Live evidence

Artifact	Public link
Sepolia registry	Explorer
Creditcoin verifier	Explorer
Project escrow	Explorer
Live JSON manifest	Application endpoint

The live sample is deliberately scoped to testnet. It is not a claim of mainnet deployment or production funds.

03 Experience and submission assets

The guided workspace gives a visitor a no-wallet path through the product: generate a session-specific evidence commitment, switch between reviewer roles, reach quorum, and record a policy-controlled release. These records are synthetic application records with no monetary value.

The live Attestcoin sample is linked separately so the interactive experience stays safe and repeatable while the cross-chain integration remains independently verifiable.

Application	emberline.onrender.com
Repository	github.com/Nifemi0/Emberline
Demo video	Emberline motion demo
Technical brief	This PDF

Official submission checklist

- + Select one official sector: RWA is the recommended fit.
- + Provide the GitHub repository with this README and the technical brief PDF.
- + Provide the public demo video URL.
- + Provide team member name, email, bio, role, residence, and citizenship in the DoraHacks form.
- + Confirm original-work, testnet-deployment, Attestcoin integration, and third-party-rights requirements.
